Mass spectrometry and characterization of Aedes aegypti trypsin
modulating oostatic factor (TMOF) and its analogs.";
Insect Biochem. Mol. Biol. 23:703-712(1993).
-I FUNCTION: Has an oostatic activity, Inhibits trypsin biosynthesis
in the midgut which indirectly reduces the vitellogenin
concentration in the hemolymph resulting in inhibition of oocyte
                                                                                                                                                                                                                                                                                                                                                                                                                01-NOV-1990 (Rel. 16, Created)

"Characterisation of peptide-N4-(N-acetyl-beta-glucosaminyl) asparagine amidase A and its N-glycans.";
Bur. U. Biochem. 252:118-123(1998).
-!- CATALYTIC ACTIVITY: Hydrolygis of an N(4)-(acetyl-beta-D-glucosaminer lesidue may be further glycosylated, to yield a (substituted) N-acetyl-beta-D-glucosaminyl)asparagine residue may be further glycosylated, to yield a (substituted) N-acetyl-beta-D-glucosaminylamine and the peptide containing an aspartic residue.
-!- SUBUNIT: Heterodimer of a large and a small chain.
-!- FYFW: Is highly glycosylated and is resistant against self-
                                                                                                                                                                                                                                                                                                                                                                                                                           deglycosylation.

T., Nicholson E.B., Jones B.D., Lynch M.J., Mobley H.L.T., "Morganella morganii urease: purification, characterization, and isolation of gene sequences.";
J. Bacteriol. 177:3073-3080(1990).
-!- CATALYTIC ACTIVITY: Urea + H(2)O = CO(2) + 2 NH(3).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the urease gamma subunit family.

Lethal Toxin Neutralising Factor peptide from opossum - can neutralise venom(8) from all major families of poisonous snakes.

Claim 7; Col 11; 11pp; English.

This sequence represents the peptide of the invention. It is a Lethal Toxin Neutralising Factor (LTNF) moiety from a 68 kDa anti-haemorrhagic protein derived from an opossum. The peptide can be used in a method for treating a victim of envenomation from a poisonous snake, preferably a poisonous snake from the family of Elapidae, Viperidae or sea snake. It is useful for the treatment of snake bites, sepsis, allergies caused by the environment and treatment of bee or scorpion stings or toxicities caused by plant or bacterial toxins. The peptide can also be used in histamine reaction treatment. The peptide can be used in envenomation treatment for a variety of snakes without prior identification of the

                                                                                                                                    ð
                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                    The sequences given in ABB80222-28 represent lethal toxin neutralising factor (ICTP) peptides which may be used for reducing elevated levels of secum proteins selected from immunoglobulin E (ISE), insure growth factor (MCF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum ISE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythmatcosus (SLE), rheumatoid arthitis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, diabetes, autoimmune of Hodgin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva cannel using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva proteins collecting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins from serum requires a more complicated sandwich type ELISA

The sequences given in ABBB0222-28 represent lethal toxin neutralising factor (LTMF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (1gB), nerve growth factor (NGF), insulin, myoglobin and/or adenosine deaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLB), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, dations or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva collection is relatively non-invesive when compared to blood collection for serum. Saliva can be centrifuged immediately, whereas blood requires collecting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins from serum requires a more complicated sandwich type ELISA
                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lethal toxin neutralising factor; LTNF; serum protein; immunoglobulin E; 198; nerve growth factor; NGF; insulin; myoglobin; adenosine deaminase; ADA; asthma; diabetes; autoimmune disease; systemic lupus erythematosus; SiE; rheumatoid arthritis; Siogren's syndrome; Reiter's syndrome; Graves' disease; Addison's disease; Hodgkin's disease; depression;

```
The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTNF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (1gE), insive growth factor (NGF), insulin, myoglobin and/or adenosinase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, clabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, at disease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva proteins

The present sequence represents a mutated portion of an integrase. The specification describes a method for targeting integration of retrotransposon of Tyl-copia group to desired location on a chromosome. The method uses a modified integrase in a retrotransposon, where the modified integrase contains a coding sequence for a peptide portion which specifically binds to protein bound to the chromosome or to particular nucleic acid sequences on chromosome. The method is useful for targeting integration of a retrotransposon of the Tyl-copia group to a desired location on a chromosome, especially into silent chromatin. The silent chromatin targeting of Ty5 is useful for tagging genes which are affected by aging and for studying oncogenes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Targeting integration of retrotransposon or retrovirus into silent chromatin by transforming a cell with modified integrase having a coding sequence for a peptide portion that interacts with chromatin at desired

The present invention describes synthetic genes encoding plant gums and other hydroxyproline (Hyp)-rich glycoproteins (HRGPs) and the nucleic acids that encode them. The nucleic acids, proteins and methods from the present invention may be used to produce HRGPs, repetitive proline-rich proteins (RRPs) and arabinoglactan-proteins (AGPs) in plants via recombinant methodologies. Also described is the expression of synthetic genes designed from repetitive peptide sequences, such as glycoproceins (including the peptide sequences of gum arabic glycoprotein (GAGP)). ABLS1730 to ABLS1849 and ABRYB401 to ABBYB544 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic peptide having a human leukocyte antigen binding motif #2599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytocoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.
                                                                                                                                                                                    Nucleic acids and proteins useful for producing hydroxy-proline rich
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Grey HM,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes synthetic genes encoding plant gums and other hydroxyproline (Hyp)-rich glycoproteins (HRGPs) and the nucleic acids that encode them. The nucleic acids, proteins and methods from the present invention may be used to produce HRGPs, repetitive proline-rich proteins (RPRPs) and arabinogalactan-proteins (AGPs) in plants via recombinant methodologies. Also described is the expression of synthetic genes designed from repetitive peptide sequences, such as glycoproteins (including the peptide sequences of gum arabic glycoprotein (GAGP)).

having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allale (i.e. HLA-A subtypes HLA-A21, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotocxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for influsion back into a patient. The polymucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein or peptide fragments useful in the treatment and prophylaxis of

The sequences are useful in the treatment or prophylaxis of cancer. The sequences are useful in the treatment or prophylaxis of cancer paincreatic cancers, lung, ovarian, cervical, colorectal, prostate or paincreatic cancers, malignant melanoma, leukaemias, lymphomas, or biliary tract carcinomas. They are useful for generating telomerase T lymphocytes capable of recognising and destroying tumour cells in a mammal, comprising culturing T lymphocytes obtained from the mammal with the peptides. Telomerase protein is expressed only by tumour cells, hence, cells. Note: This sequence was indexed from WO200002581, which is the first major country equivalent to NO9803141

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AARS9496-R61666 are immunogenic 10mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (AAR71293). AAR61547 has an ICS0 of 0.0042 and the sequence occurs at position 2803 in the HCV LORF protein. The peptides of the invention can induce cytcoxic T tymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SH3 ligand; SH3 binding agent; biased phage library; recognition sequence; src SH3 domain; Paget's disease; restenosis; rheumatoid arthritis; gout; neutrophil oxidase; tyrosine kinase; p47; p67; complex; chronic myelogenous leukaemia; cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antiganic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1.2 or A24.1 or HLA-B or C) and induce a cytocoxic T cell response against the antigen from which the peptide is derived. Cytocoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in cancers in mammals (especially to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B cancers in mammals (especially humans) e.g. prostate cancer, hepatitis and C. AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to the peptide e.g. to produce CILs ex vivo for influsion back into a the peptide e.g. to produce CILs ex vivo for influsion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful therapeutically and for immunisation as above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nephrotropic; neuroprocective; antiarchritic; antirheumatic; immunosuppressive; dermatological; muscular; nephrotropic; thyromimetic; hamunosuppressive; dermatological; muscular; nephrotropic; thyromimetic; hamunosenic peptide composition; immune response, prostate cancer; hepatitis B, hepatitis C, AIDS; renal carcinoma; cervical carcinoma; lymphoma; cytomegalovirus; CMV; condlylloma acuminatum; autoimmune associated disorder; multiple sclerosis; rheumatoid arthritis; Sjogren syndrome; scleroderma; polymyositis; dermatomyositis; arkylosing spondylitis; myasthenia gravis; MG; bullous pemphigoid; pemphigus; glomerulonephritis; Godpasture's syndrome; autoimmune haemolytic anaemia; Hashimoto's disease; pernicious anaemia; human leukocyte anitgen A2.1; HLA A2.1;
                                                                                                                                                                                                                                                                       New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; anti-inflammatory; hepatotropic; virucide; anti-HIV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR93272-342 represent peptides which are SH3
[1gands/SH3 binding agents. They represent a biased phage library which
comprises six random amino acids flanking the tetrapeptide -PPIP which
comprises six random amino acids flanking the tetrapeptide -PPIP which
was identified as a recognition sequence for the src SH3 domain. These
sequences were identified using the method of the invention. The method
comprises contacting the SH3 domain with a mixture of peptides under
conditions permitting a ligand to bind to an SH3 domain to form a
complex. Any unbound peptides are removed and the complexed peptide
ligands are dissociated from the complexes. The selected peptide
such the SH3 domain are detected. The selected peptides are
enriched by re-contacting them with the SH3 domain and then candidates
which bind to the SH3 domain are detected. The isolated SH3 binding
peptides may be used in the dispossis, prevention and treatment of
conditions or diseases resulting from cellular processes mediated by an
SH3-based interaction. Such diseases include Paget's disease. Other
conditions treatable with these peptides include restences; rheumatoid
arthritis, gout and other problems in which an SH3 of neutrophil oxidase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention describes an immunogenic peptide composition comprising 9 residues including a first conserved residue at a second position from N-cerminus, and a second conserved residue at C-terminal position. The inventive peptide composition is used to elicit an immune response against a desired antigen for preventing, treating or diagnosing pathological states, e.g. prostate cancer, hepatitis B. hepatitis C, ALDS, renal carcinoma, cerrical carcinoma, lymphoma, cytomegalovirus (CMV), and condlylloma acuminatum. It is also used to treat autoimmune associated disorders, e.g. multiple sclerosis, rheumatoid arthritis, Slogren syndrome, scleroderma, polymyositis, dermatomyositis, systemic lupus erythematosus, juvenile rheumatoid arthritis, alponentionephritis, Goodpasture's syndrome, autoimmune hemolytic anemia, Hashimoto's disease, permictous anaemia, didopathic thrombocytopenic purpura, Grave's disease, and Addison's disease. The invention defines positions within a motif enabling the selection of the peptides, which will bind efficiently to human leukcoyve anitgen (HLA) A2.1. This is the amino acid sequence of an immunogenic HLA-A2.1 binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                      Immunogenic peptide composition for preventing, treating or diagnosing pathological states, e.g. prostate cancer, hepatitis B and C, Acquired Immunodeficiency Syndrome, and renal carcinoma, includes conserved residues at specified positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 11; Page 25; 38pp; English.

i Sequence 23, Application US/09758128

i Sequence 23, Application US/09758128

i Patent No. US20020107187A1

i GENERAL INFORMATION:

APPLICANT: KINGSTON, David J.

APPLICANT: WESTERROOK, Simon L.

ITLE OF INVENTION: MODULARING THE ACTIVITY OF HORMONES OR THEIR RECEPTORS

ITLE OF INVENTION: MODULARING THE ACTIVITY OF HORMONES OR THEREOF

ITLE OF INVENTION: MODULARING THE ACTIVITY OF HORMONES OR THEREOF

ITLE OF INVENTION: PEPTIDES, ANTIBODIES, VACCINES AND USES THEREOF

CURRENT FILING DATE: 105/09/758,128

PRIOR APPLICATION NUMBER: 09/194,218

PRIOR APPLICATION NUMBER: 09/194,218

PRIOR APPLICATION NUMBER: 09/194,218

PRIOR PELING DATE: 1996-05-05

NUMBER OF SEQ ID NOS: 58

SOFTWARE: PATENTIN VET: 2.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 13,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 168, Application US/09547693

Patent No. 6639050
GRNERAL INFORMATION:
APPLICANT: Kieliaszawski, Marcia
APPLICANT: Kieliaszawski, Marcia
TITLE OF INVENTION:
Synthetic Genes for Plant Gums and Other Hydroxyproline-Rich
TITLE OF INVENTION: Glycoproteins
FILE REPERENCE: OHU-04089
CURRENT APPLICATION NUMBER: US/09/547,693
CURRENT FILING DATE: 2000-04-12
NUMBER OF SEQ ID NOS: 236
                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ; LOCATION: (3)..(4)

Sequence 165, Application US/09547693
Fatent No. 6639050
GENERAL INFORMATION:
APPLICANT: Kielisewski, Marcia
TITLE OF INVENTION: Synthetic Genes for Plant Gums and Other Hydroxyproline-Rich
TITLE OF INVENTION: Glycoproteins
FILE REFERENCE: OHU-04089
CURRENT APPLICATION NWBER: US/99/547,693
CURRENT APPLICATION NWBER: 2000-04-12
NUMBER OF SEQ ID NOS: 236
SSOTWARE: PatentIn version 3.0
LENGTH: 10

CITY: Gainesville
STATE: FL
COMPUTER: USA
Z1266
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/271,698
FILING DATE: 07-JUL-1994
CLASSIFICATION DATA:
APPLICATION NUMBER: US/07/989,290
FILING DATE: 11-DEC-1992
ATORNEY/AGENT INFORMATION:
NAME: SA11wanchik, David R.
REGISTRATION NUMBER: 31,794
REGISTRATION SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LEMETHER OF SEQ ID NO: 2:
REGISTRATION OF SEQ ID NO: 2:
SEQUENCE CHARACTERISTICS:
LEMETHER OF SEQ ID NO: 2:
SEQUE
APPLICATION TO STATE THIS DATE: 19921211
CLIASSIFICATION: 435
ATTORNEY AGENT INFORMATION:
NAME: Saliwanchik, David R.
REGISTRATION NUMBER: 17,794
REFERENCE/DOCKET NUMBER: UF/SES-127
TELEPHONE: 904-375-8100
TELEPHONE: 904-372-5800
INFORMATION FOR SEQ ID NO: 2: SEQUENCE CHARACTERISTICS:
LENGTH: 6 amino acids
TYPE: AMINO ACID
STRANDEDDESS: single
TYPE: AMINO ACID
STRANDEDDESS: single
TOPOLOGY: linear

                                                                                                                                                        Sequence 3, Application US/07989290

Patent No. 5358934

GENERAL INFORMATION:

APPLICANT: Borowsky, Dov

TITLE OF INVENTION: Materials and Methods for Control

TITLE OF INVENTION: Of Pests

NUMBER OF SEQUENCES: 4

CORRESPONDENCE ADDRESS:

ADDRESSE: David R. Saliwanchik

STREET: 2421 N.W. 418t Street, Suite A-1

CITY: Gainesville
  1; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 7;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3, Application US/08271698

Sequence 3, Application US/08271698

Patent No. 5439821

The present sequence is from the N terminus of a 68 kD protein purified from the serum of the opossum Didelphis virginiana. The full-length protein is a lethal toxin neutralising factor (LTNF). The use of purified LTNF or of the chemically synthesised 15mer N terminal peptide for treating victims of bee stings, scorpion stings and bacterial or plant toxins is claimed. The patent disclosure does not provide any evidence for neutralising activity against these various toxins. There is evidence of significant neutralising activity of the opossum LTNF and the 15mer peptide against venom from snakes of the families Crotalidae, Blaphidae, Hydrolidae and Viperidae. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treatment of victims of bee or scorpion stings or plant or bacterial toxins - by admin. of lethal toxin-neutralising factor or its N-terminal

It is a Lethal Toxin Neutralising Factor (LTNF) moiety from a 68 kba anti-haemorrhagic protein derived from an opossum. The peptide can be used in a method for treating a victim of envenomation from a poisonous snake, preferably a poisonous snake from the family of Elapidae, Viperidae or sea snake. It is useful for the treatment of snake bites, sepsis, allergies caused by the environment and treatment of bee or scorpion stings or toxicities caused by plant or bacterial toxins. The peptide can also be used in histamine reaction treatment. The peptide can be used in envenomation treatment for a variety of snakes without prior identification of the snake. Being short it can be synthetically prepared rather than the current production in horses, where some people can show hypersensitivity
                                                                                                                                                                                                                                                                              LTNF; lethal toxin neutralising factor; opossum; envenomation; therapy; anti-haemorxhagic protein; Elapidae; Viperidae; sea snake; snake bite; sepsis; allergy; bee sting; scorpion sting; plant toxin; bacterial toxin; histamine reaction treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lethal Toxin Neutralising Factor peptide from opossum - can neutralise venom(s) from all major families of poisonous snakes.

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTNF) peptides which may be used for reducing elevated levels of factor (LTNF) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (IGE), nerve growth factor (NGF), insulin, myoglobin and/or adenoined edaminase (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IGE levels, e.g. asthma, albetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogran's syndrome, Reiter's syndrome, Graves' disease, atthritis, Sjogran's syndrome, Reiter's syndrome, Graves' disease, con Addison's disease or Hodgkin's disease) or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immensionent assay (ELISA) on a saliva sample using an anti-serum that is specific for the protein. Saliva con be centrifuged immediately, whereas blood collection (for serum. Saliva can be centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed as a part of the proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test, whereas an assay of proteins from the assayed by a simple ELISA test.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                               Assaying a human endogenous protein (e.g. IgE, nerve growth factor, insulin or adenosine deaminase or myoglobin), useful for diagnosing asthma or diabetes, by employing an ELISA on a saliva sample from a
  The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTME) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (IgE), nerve growth factor (MGF), insulin, myoglobin and/or adenosibase (AbA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva sample using an arti-serum that is specific for the protein. Saliva collection is relatively non-invasive when compared to blood collection for serum. Saliva proteins

The sequences given in ABB80222-28 represent lethal toxin neutralising factor (LTMP) peptides which may be used for reducing elevated levels of serum proteins selected from immunoglobulin E (IgE), nerve growth factor (NGF), insulin, myoglobin and/or adenosinse (ADA). In particular, the methods of the invention are useful for diagnosing and treating conditions with elevated serum IgE levels, e.g. asthma, diabetes, autoimmune disease (e.g. erythematosus (SLE), rheumatoid arthritis, Sjogren's syndrome, Reiter's syndrome, Graves' disease, Addison's disease, or depression. The efficacy of the protein may be monitored by assaying a human endogenous protein by performing an enzyme-linked immunosorbent assay (ELISA) on a saliva collection is relatively non-invesive when compared to blood collection of the serum. Saliva can be centrifuged immediately, whereas blood requires
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                           clotting time before centrifugation to separate serum. Saliva proteins can be assayed by a simple ELISA test, whereas an assay of proteins from serum requires a more complicated sandwich type ELISA
